

EXPERIMENT 2

1. **AIM:**

To perform ETL and data transformation using Microsoft Power BI.

2. **OBJECTIVES:**

- To understand the basic stages of ETL in Power BI.
- To perform data cleaning and transformation using Power Query.
- To combine and organize data from different worksheets.
- To establish relationships between tables in the data model.
- To create calculated measures using DAX.
- To develop a basic analytical report from the transformed data.

3. **TOOLS / SOFTWARE REQUIRED:**

- Microsoft Power BI Desktop
- Global Superstore Dataset.xlsx
- Power Query Editor – built into Power BI Desktop
- DAX (Data Analysis Expressions)

4. **DATASET USED:** Global Superstore Dataset.xlsx.

5. **THEORY:**

ETL (Extract, Transform, Load) is a data preparation process used to collect data from a source, modify it into a suitable format, and load it into an environment for analysis.

Extract refers to obtaining data from a source such as an Excel workbook. In this experiment, the Orders, Returns, and People worksheets are imported into Power BI. Transform involves preparing the extracted data for analysis. Common transformations include removing duplicate or blank records, changing data types, renaming columns, creating new columns, and standardizing values. Power Query provides tools for performing these transformations and records them as applied steps.

Load is the process of applying the transformations and loading the prepared tables into the Power BI data model. The model can then contain relationships between tables for analysis. Power BI provides modeling features for creating and managing table relationships.

DAX (Data Analysis Expressions) is a formula language used in Power BI for creating calculations such as measures and calculated columns. Measures are dynamic calculations whose results can change according to the filters and selections in a report.

In this experiment, ETL is used to prepare the Global Superstore data, while DAX measures are used to calculate important business metrics such as sales, profit, profit margin, and order count.

- **PROCEDURE:**

Part A: Extract – Connect to Dataset

Step 1: Download the Global Superstore dataset.

Download the Global Superstore Dataset.xlsx file and save it in the experiment folder.

Step 2: Open Power BI Desktop and connect to the Excel dataset.

Home > Get Data > Excel Workbook

Select Global Superstore Dataset.xlsx > Transform Data

Step 3: Import the required worksheets.

Row ID	Order ID	Order Date	Ship Date	Ship Mode	Customer ID	Customer Name	Segment	Postal Co

22178	IN-2016-LS172307-42490	Saturday, April 30, 2016	Friday, May 6, 2016	Standard Class	LS-172307	Lycoris Saunders	Consumer	

Select the following worksheets:

- Orders
- Returns
- People

Verify that all three tables appear in the Queries pane of Power Query Editor.

Part B: Transform – Power Query Editor

Step 4: Open Power Query Editor.

Home > Transform Data

The screenshot shows the Power Query Editor interface. The ribbon includes 'File', 'Home', 'Transform', 'Add Column', 'View', 'Tools', and 'Help'. The 'Transform' tab is active, showing options like 'Close & Apply', 'New Source', 'Recent Sources', 'Enter Data', 'Data source settings', 'Manage Parameters', 'Export query results', 'Refresh Preview', 'Advanced Editor', 'Choose Columns', 'Remove Columns', 'Keep Rows', 'Remove Rows', 'Sort', 'Split Column', 'Group By', 'Data Type: Whole Number', 'Use First Row as Headers', 'Merge Queries', 'Append Queries', and 'Combine Files'. The 'Query Settings' pane on the right shows the 'Properties' tab with the name 'Orders' and the 'Applied Steps' list: Source, Navigation, Promoted Headers, and Changed Type. The main data area shows a table with columns: Row ID, Order ID, Order Date, Ship Date, and Ship Mode. The table contains 15 rows of data. The status bar at the bottom indicates '24 COLUMNS, 999+ ROWS' and 'Column profiling based on top 1000 rows'.

Select the Orders table.

Step 5: Transform the Orders table.

Apply the following transformations:

The screenshot shows the Power Query Editor interface. The ribbon includes 'File', 'Home', 'Transform', 'Add Column', 'View', 'Tools', and 'Help'. The 'Transform' tab is active, showing options like 'Transpose', 'Reverse Rows', 'Detect Data Type', 'Fill', 'Pivot Column', 'Convert to List', 'Merge Columns', 'Split Column', 'Format', 'Text Column', 'Statistics', 'Standard', 'Scientific', 'Trigonometry', 'Rounding', 'Information', 'Date', 'Time', 'Duration', 'Run R script', and 'Run Python script'. The 'Query Settings' pane on the right shows the 'Properties' tab with the name 'Orders' and the 'Applied Steps' list: Source, Navigation, Promoted Headers, Changed Type, Removed Duplicates, Removed Blank Rows, Inserted Year, Inserted Month Name, Added Custom, Changed Type1, Multiplied Column, and Capitalized Each Word. The main data area shows a table with columns: Shipping Cost, Order Priority, Year, Month Name, and Profit margin. The table contains 21 rows of data. The status bar at the bottom indicates '27 COLUMNS, 999+ ROWS' and 'Column profiling based on top 1000 rows'.

- Remove duplicate records.
- Remove blank rows.
- Verify and correct data types.
- Rename columns where required.
- Extract Year and Month from Order Date.
- Create a Profit Margin derived column.
- Standardize Region and Segment values.

Review the transformations in the Applied Steps section.

Step 6: Transform the Returns table.

Select the Returns table and:

- Remove duplicate Order IDs.
- Check for missing values.
- Standardize the Returned field values.

The screenshot displays the Power Query Editor window. The main area shows a table with 3 columns and 21 rows of data. The columns are labeled 'Returned', 'Order ID', and 'Region'. The 'Returned' column contains values like 'Yes', 'No', and 'Maybe'. The 'Order ID' column contains alphanumeric strings. The 'Region' column contains names of regions like 'Southern Asia', 'North Africa', 'Central Africa', and 'South America'.

The 'Applied Steps' pane on the right shows a list of transformations applied to the data. The steps are: Source, Navigation, Changed Type, Removed Duplicates, Removed Blank Rows, and Capitalized Each Word. The 'Capitalized Each Word' step is currently selected.

The 'Query Settings' pane on the right shows the 'Name' of the query as 'Returns'.

The bottom status bar indicates '3 COLUMNS, 999+ ROWS' and 'Column profiling based on top 1000 rows'. The bottom right corner shows 'PREVIEW DOWNLOADED AT 3:55 PM'.

Step 7: Transform the People table.

Power Query Editor interface showing the 'People' table. The table has 2 columns and 24 rows. The 'Region' column lists various geographical areas. The 'Applied Steps' pane on the right shows the sequence of transformations applied to the data, including 'Removed Top Rows'.

Person	Region
1 Marilène Rousseau	Caribbean
2 Andile thejirika	Central Africa
3 Nicodemo Bautista	Central America
4 Cansu Peynirci	Central Asia
5 Lon Bonher	Central US
6 Wasswa Ahmed	Eastern Africa
7 Hadia Bousaid	Eastern Asia
8 Lynne Marchand	Eastern Canada
9 Oxana Lagunov	Eastern Europe
10 Dolores Davis	Eastern US
11 Lindiwe Afolayan	North Africa
12 Miina Nylund	Northern Europe
13 Kauri Anaru	Oceania
14 Vasco Magalhães	South America
15 Preecha Metharom	Southeastern Asia
16 Nora Cuijper	Southern Africa
17 Chandrakant Chaudhri	Southern Asia
18 Gavino Bove	Southern Europe
19 Flannery Newton	Southern US
20 Katlego Akosua	Western Africa
21 Kaoru Xun	Western Asia

Select the People table and:

- Validate regional assignments.
- Remove unnecessary columns.
- Verify consistency of region names.

Step 8: Merge the Orders and Returns tables.

Power Query Editor interface showing the 'Orders' table merged with the 'Returns' table. The table has 28 columns and 999+ rows. The 'Applied Steps' pane on the right shows the sequence of transformations applied to the data, including 'Merged Queries'.

Order ID	Year	Month Name	Profit margin	Returns
1 dium	2017	March	13.99524473	Table
2 dium	2015	September	42.90465632	Table
3 dium	2017	March	3.976091476	Table
4 dium	2017	March	46.95898161	Table
5 dium	2015	September	11.94820483	Table
6 n	2015	April	13.9976006	Table
7 dium	2017	August	40.9970292	Table
8 n	2017	December	38.99862196	Table
9 dium	2016	September	37.99424874	Table
10 n	2017	December	22.99676608	Table
11 dium	2015	December	38.99527481	Table
12 n	2017	July	41.96556671	Table
13 n	2015	September	0.989682038	Table
14 n	2016	November	10.99611902	Table
15 n	2016	January	17.98107256	Table
16 n	2016	January	12.99561945	Table
17 n	2015	September	5.993461678	Table
18 n	2017	July	28.97058824	Table
19 cal	2014	November	26.999727	Table
20 dium	2015	June	42.99858557	Table
21 n				

Use the Order ID field to merge the two tables.

Orders > Merge Queries > Returns > Order ID

Select the appropriate join condition and apply the merge.

Step 9: Review and apply the transformations.

Review all Applied Steps for the three tables.

Click:

Home > Close & Apply

The transformed data is then loaded into the Power BI data model.

Part C: Load – Build Data Model

Step 10: Open Model View.

Select the Model View icon from the left navigation pane in Power BI.

Step 11: Create relationships between the tables.

Create the following relationships:

- Orders ↔ Returns using Order ID
- Orders ↔ People using Region

Verify that the relationships are correctly established in the model.

Step 12: Create DAX measures.

Select the Orders table and create the following measures using New Measure:

1. Total Sales = SUM(Orders[Sales])
2. Total Profit = SUM(Orders[Profit])
3. Profit Margin = DIVIDE(SUM(Orders[Profit]),SUM(Orders[Sales]))
4. Total Orders = DISTINCTCOUNT(Orders[Order ID])

These measures are used to perform analytical calculations and display key business performance indicators.

Step 13: Create the BI report/dashboard.

Create a Power BI report using the transformed data and DAX measures.

The final dashboard includes:

- Total Sales
- Total Profit
- Profit Margin
- Total Orders
- Sales by Category bar chart

- Profit by Category pie chart
- Profit Margin vs Discount scatter chart
- Detailed Sales & Profit Analysis table

Add the dashboard title:

GLOBAL SUPERSTORE – ETL & SALES ANALYSIS

6. RESULT

The Global Superstore data was successfully extracted and transformed using Power Query. The required tables were cleaned, combined, and loaded into the Power BI data model. Relationships and DAX measures were created successfully, and the transformed data was used to prepare an analytical Power BI report.

7. LEARNING OUTCOMES

- Learned the practical workflow of ETL in Power BI.
- Gained experience in transforming raw business data using Power Query.
- Learned how to prepare multiple tables for analysis.
- Understood how relationships connect tables within a Power BI data model.
- Gained practical knowledge of creating DAX measures.
- Learned how dynamic measures can be used in Power BI reports.
- Learned how transformed data can be used to create business-oriented visualizations.
- Developed practical skills in preparing an interactive analytical report.
- Understood how data preparation and modeling improve the quality of business analysis.
